(~1.1 eV) and germanium (~0.66 eV) are common examples.

- Intrinsic Semiconductors: Pure materials where conduction is due to thermally generated electron-hole pairs.
- Extrinsic Semiconductors: Doped materials with added impurities to modify electrical conductivity.

Charge Carriers and Doping

- Electrons and Holes: The primary charge carriers in semiconductors.
- Doping Types:
 - n-type: Doping with elements like phosphorus or arsenic introduces extra electrons.
 - p-type: Doping with elements like boron or gallium creates holes.
- Doping Concentration: Determines the level of conductivity and influences device characteristics.

Carrier Statistics and Mobility

- Fermi-Dirac Statistics: Describe the probability of occupancy of energy states by electrons.
- Carrier Concentration: Depends on temperature and doping levels.
- Mobility (?): Influences how quickly carriers can move through the material under an electric field; affected by lattice scattering, impurity scattering, and temperature.

Electrical Properties and Behavior of Semiconductors

Streetman emphasizes the importance of understanding how charge carriers respond to electric fields, temperature, and external influences.
