Sorting is achieved with `xsl:sort` within `xsl:for-each` or `apply-templates`:

- Sort by attribute or element content
- Specify order: ascending or descending

Using User-Defined Functions

XPath 2.0 allows defining custom functions for reuse and cleaner code:

- Functions are declared within `xmlns:my="http://example.com/myns"`
- Syntax:

Expression using \$param1

Handling Multiple Data Types

XPath 2.0 introduces rich data types such as:

XSLT 2.0 and XPath 2.0 Programmer's Reference Guide

In the realm of XML processing, XSLT 2.0 and XPath 2.0 have established themselves as powerful, versatile standards for transforming and querying XML documents. For developers and programmers working extensively with XML data, a comprehensive understanding of these standards is essential. This review delves into the core features, capabilities, and practical applications of XSLT 2.0 and XPath 2.0, offering an in-depth perspective on their strengths and nuances.

Introduction to XSLT 2.0 and XPath 2.0

XSLT 2.0 (Extensible Stylesheet Language Transformations) is a language designed for transforming XML documents into different formats such as XML, HTML, or plain text. Its primary purpose is to facilitate the presentation and restructuring of XML data, often used in web development, data integration, and document management systems.

XPath 2.0 is a language for navigating and selecting nodes within an XML document. It serves as the backbone for XSLT 2.0, enabling precise, flexible, and powerful querying capabilities.

Together, these standards significantly enhance XML processing, offering features that surpass their predecessors (notably XPath 1.0 and XSLT 1.0), including richer data types, improved expression syntax, and more robust functions.

Evolution from XSLT 1.0 and XPath 1.0

While XPath 1.0 and XSLT 1.0 laid the foundational concepts, their limitations prompted the development of version 2.0:

- **Enhanced Data Types:** XPath 2.0 introduces a rich type system, including string, numeric, date/time, and user-defined types, enabling more precise data handling.
- **Improved Expressions:** XPath 2.0 supports sequences, making it possible to work with multiple items as a single unit.
- **Advanced Functions:** Both standards introduce a wide array of built-in functions, including string

manipulation, date/time calculations, and more.

- Modularity and Extensibility: XSLT 2.0 supports importing and including other stylesheets, promoting modular design.
- Namespace Support: Better handling of XML namespaces, crucial for complex XML vocabularies.

Core Features of XPath 2.0

2.1 Data Model and Data Types

XPath 2.0 introduces a strongly typed data model based on XML Schema. This enables:

- Precise data typing (e.g., `xs:integer`, `xs:date`, `xs:decimal`).
- Support for sequences: ordered collections of items, which can be zero, one, or many.
- Type-aware functions that validate and process data effectively.

2.2 Expressions and Navigation

XPath 2.0 extends the navigation capabilities with:

- Path expressions that can return sequences.
- Predicate expressions for filtering nodes.
- Axes such as `ancestor`, `descendant`, `following-sibling`, etc., for flexible navigation.
- Filter expressions (`for`, `let`, `where`, `order by`) similar to SQL for complex querying.

2.3 Functions and Operators

A vast array of built-in functions include:

- String functions: `substring()`, `contains()`, `normalize-space()`.
- Numeric functions: `round()`, `ceiling()`, `floor()`.
- Date/time functions: `current-date()`, `adjust-dateTime-to-timezone()`, `days-from-duration()`.
- Type conversion functions: `cast-as()`, `castable-as()`.
- Sequence functions: `count()`, `distinct-values()`, `exists()`.

- ``.`` : Current node.
- ``..`` : Parent node.
- ``@`` : Selects attributes.

Example:

``//div[@class='article']`` selects all ``` elements with class "article".

Common XPath Axes and Functions

- ``child::`` : Selects children of the current node.
- ``descendant::`` : Selects all descendants.
- ``parent::`` : Selects the parent node.
- ``following-sibling::`` and ``preceding-sibling::`` : Select sibling nodes.
- ``text()`` : Selects the text content of a node.
- ``contains()`` : Checks if a string contains a substring.
- ``starts-with()`` : Checks if a string starts with a substring.
- ``@attribute`` : Selects attributes.

Example:

``//a[contains(@href, 'download')]'`` selects all ``` tags with an ``href`` attribute containing "download".
