As students and professionals delve into advanced topics like Cost Accounting 401, they often encounter complex problems that require a deep understanding of cost concepts, methodologies, and analytical techniques. This article aims to explore common Advance Cost Accounting 401 problems and solutions, providing clarity and practical approaches to tackle these challenges effectively.

Understanding the Scope of Cost Accounting 401

Before diving into specific problems, it's crucial to understand what Cost Accounting 401 entails. This advanced course covers topics such as:

- Cost classification and analysis
- Cost allocation and apportionment
- Marginal costing and contribution analysis
- Standard costing and variance analysis
- Budgeting and control
- Activity-based costing
- Joint and by-product costing
- Cost control in complex manufacturing environments

Students often face intricate problems involving these topics, especially when integrating multiple concepts into real-world scenarios.

Common Problems in Advance Cost Accounting 401

Below are some typical problems encountered by students and professionals, along with their solutions.

1. Cost Allocation and Apportionment

Problem:

A manufacturing company has two departments: Production and Administration. The total overhead costs are \$120,000. The following data is available:

Department	Direct Labour Hours	Overheads to be allocated
------------	---------------------	---------------------------

-----	-----	-----
-------	-------	-------

Production	10,000	\$80,000
------------	--------	----------

Administration	2,000	\$40,000
----------------	-------	----------

Allocate the overheads to each department accurately using the appropriate basis.

Solution:

Since overheads are to be allocated based on direct labour hours:

- Total direct labour hours = 10,000 + 2,000 = 12,000 hours

- Overhead rate per labour hour = Total overheads / Total labour hours = \$120,000 / 12,000 = \$10 per hour

- Allocation:

- Production: 10,000 hours × \$10 = \$100,000

- Administration: 2,000 hours × \$10 = \$20,000

Note: The initial data suggests overheads are already categorized, but the problem emphasizes proper allocation based on the chosen basis.

2. Standard Costing and Variance Analysis

Problem:

A company sets the standard cost for 1 unit of product as follows:

- Direct materials: 2 kg @ \$5/kg = \$10
- Direct wages: 3 hours @ \$8/hour = \$24

During the period, the actual data are:

- Materials used: 2.2 kg per unit at \$5.50/kg
- Labour hours: 3.2 hours per unit at \$8.50/hour
- Actual units produced: 1,000 units

Calculate the materials and labour variances.

Solution:

Materials Variances:

- Material Price Variance (MPV):

= (Actual Price - Standard Price) × Actual Quantity

= (\$5.50 - \$5.00) × (2.2 kg × 1,000 units)

= \$0.50 × 2,200 kg = \$1,100 Unfavorable

- Material Usage Variance (MUV):

= (Actual Quantity - Standard Quantity) × Standard Price

= (2.2 kg - 2 kg) × \$5 × 1,000 units

= 0.2 kg × \$5 × 1,000 = \$1,000 Unfavorable

Labour Variances:

- Wage Rate Variance (WRV):

= (Actual Rate - Standard Rate) × Actual Hours

$$= (\$8.50 - \$8) \times (3.2 \text{ hours} \times 1,000 \text{ units})$$

$$= \$0.50 \times 3,200 \text{ hours} = \$1,600 \text{ Unfavorable}$$

- Labour Efficiency Variance (LEV):

$$= (\text{Actual Hours} - \text{Standard Hours}) \times \text{Standard Rate}$$

$$= (3.2 \text{ hours} - 3 \text{ hours}) \times \$8 \times 1,000 \text{ units}$$

$$= 0.2 \text{ hours} \times \$8 \times 1,000 = \$1,600 \text{ Unfavorable}$$

3. Marginal Costing and Break-even Analysis

Problem:

A firm produces a product with the following data:

- Selling Price per unit: \$50
- Variable Cost per unit: \$30
- Fixed Costs: \$100,000

Calculate the break-even point in units and sales value.

Solution:

- Contribution per unit:

$$= \text{Selling Price} - \text{Variable Cost} = \$50 - \$30 = \$20$$

- Break-even point (units):

$$= \text{Fixed Costs} / \text{Contribution per unit} = \$100,000 / \$20 = 5,000 \text{ units}$$

- Break-even sales value:

= Break-even units × Selling price = 5,000 × \$50 = \$250,000

This analysis helps managers understand the sales volume needed to cover all costs.

4. Activity-Based Costing (ABC) Problems

Problem:

A company allocates overheads using ABC. The following data is available:

| Cost Pool | Total Overheads | Cost Drivers | Total Driver Units |

|-----|-----|-----|-----|

| Machine setups | \$60,000 | Number of setups | 300 |

| Quality inspections | \$40,000 | Number of inspections | 200 |

Products:

| Product | Number of setups | Number of inspections | Units produced |

|-----|-----|-----|-----|

| A | 150 | 80 | 1,000 |

| B | 150 | 120 | 2,000 |

Calculate the overhead cost per unit for each product.

Solution:

- Setup cost per setup:

= \$60,000 / 300 = \$200 per setup

- Inspection cost per inspection:

= \$40,000 / 200 = \$200 per inspection

- Total overhead allocated to each product:

- Product A:

Overhead from setups: $150 \text{ setups} \times \$200 = \$30,000$

Overhead from inspections: $80 \text{ inspections} \times \$200 = \$16,000$

Total overhead: $\$46,000$

- Product B:

Overhead from setups: $150 \text{ setups} \times \$200 = \$30,000$

Overhead from inspections: $120 \text{ inspections} \times \$200 = \$24,000$

Total overhead: $\$54,000$

- Overhead per unit:

- Product A:

$= \$46,000 / 1,000 \text{ units} = \46 per unit

- Product B:

$= \$54,000 / 2,000 \text{ units} = \27 per unit

This detailed allocation helps in accurate product costing and pricing decisions.

Sample Problem with Complete Solution

Problem:

A manufacturing firm incurs overhead costs of \$200,000 annually. The firm produces two products: Product A and Product B. The overhead is allocated based on machine hours. Product A uses 1,200 machine hours, and Product B uses 800 machine hours. Determine the overhead rate per machine hour and allocate overhead costs to each product.

Solution:

- Total machine hours = $1,200 + 800 = 2,000$ hours
- Overhead rate per machine hour = $\text{Total overhead} / \text{Total machine hours} = \$200,000 / 2,000 = \$100$ per hour

Allocation:

- Product A: $1,200 \text{ hours} \times \$100 = \$120,000$
- Product B: $800 \text{ hours} \times \$100 = \$80,000$

Analysis:

- Product A bears a larger share of overhead costs.
- Managers can use this data to analyze profitability and pricing strategies.
