This comprehensive guide explores the various nutrients essential for swine, their specific requirements, and practical considerations for formulating balanced diets that meet the needs of pigs throughout their lifecycle.

Overview of Swine Nutrient Requirements

Swine require a balanced intake of energy, protein, vitamins, minerals, and water to support their physiological functions. The exact nutrient requirements vary depending on factors such as age, weight, reproductive status, health, and environmental conditions. Meeting these requirements ensures efficient growth, reproduction, and maintenance of health, while deficiencies or excesses can lead to poor performance, health issues, or environmental concerns.

Main Nutrients Essential for Swine

1. Energy

Energy is the most critical nutrient for swine, serving as the fuel for all bodily functions, including growth, reproduction, activity, and thermoregulation. The primary source of energy in swine diets is carbohydrates, supplemented by fats and, to a lesser extent, proteins.

- **Carbohydrates:** Grains such as corn, wheat, barley, and sorghum provide digestible starches that supply the majority of energy.

- **Fats:** Vegetable oils and animal fats are concentrated energy sources, increasing diet energy density.

The energy requirement is typically expressed in terms of metabolizable energy (ME) or digestible energy (DE), with recommendations adjusted according to life stage and production goals.

2. Proteins and Amino Acids

Proteins are vital for tissue growth, repair, and overall maintenance. In swine diets, protein is supplied mainly through plant-based ingredients, but the amino acid profile is equally important.

- **Essential amino acids:** These cannot be synthesized by pigs and must be supplied in the diet. Key amino acids include lysine, methionine, threonine, tryptophan, and histidine.

- **Protein sources:** Soybean meal, fish meal, and dairy by-products are common protein ingredients.

The balance and digestibility of amino acids are crucial for optimizing growth performance and feed efficiency.

3. Vitamins

Vitamins are organic compounds required in small amounts for metabolic processes, immune function, and reproductive health.

- **Fat-soluble vitamins:** A, D, E, and K.

- **Water-soluble vitamins:** B-complex vitamins and vitamin C.

While many vitamins are synthesized by the pigs' microbiota, dietary supplementation is necessary when deficiencies are suspected or in specific production phases.

4. Minerals

Minerals are inorganic elements vital for numerous physiological functions, including bone development, enzyme activity, and fluid balance.

- **Macro-minerals:** Calcium, phosphorus, sodium, potassium, magnesium, and chloride.

- **Micro-minerals:** Zinc, iron, copper, manganese, iodine, selenium, and molybdenum.

Proper mineral balance is critical, particularly calcium and phosphorus for skeletal development, and trace minerals for immune function.

5. Water
