Sample Questions and Answers from the Orbital Motion Gizmo Answer Key

Question 1: What happens to the orbital period if the orbital radius is doubled?

Answer: According to Kepler's Third Law, the orbital period increases proportionally to the $3/2$ power of the orbital radius. Therefore, doubling the radius results in the period increasing by a factor of approximately 2.83, meaning the satellite takes longer to complete one orbit.

Question 2: How does increasing the mass of the central body affect the orbital velocity of the satellite?

Answer: Increasing the mass of the central body increases the gravitational force, which results in a

higher required orbital velocity for the satellite to maintain its orbit. The relationship is directly proportional; more mass means higher velocity needed.

Question 3: Why does a satellite in a low Earth orbit travel faster than one in a higher orbit?

Answer: A satellite in a lower orbit experiences a stronger gravitational pull due to its proximity to Earth. To balance this force and stay in orbit, it must travel faster. Conversely, satellites in higher orbits require lower velocities because the gravitational force weakens with distance.
