Understanding Radioactive Decay and Half-Life

Radioactive decay is a fundamental concept in nuclear physics, describing how unstable nuclei spontaneously transform into more stable configurations by emitting radiation.

Core Concepts

- **Decay Law:** The rate of decay is proportional to the number of undecayed nuclei.
- **Half-Life:** The time required for half of the radioactive nuclei to decay.
- **Decay Constant (?):** The probability per unit time that a nucleus will decay.

Kaplan Solutions Approach

Kaplan solutions provide step-by-step methods to solve decay problems:

- Deriving the exponential decay formula $(N(t) = N_0 e^{-\lambda t})$
- Calculating half-life using $(T_{1/2} = \frac{\ln 2}{\lambda})$
- Converting between decay constant and half-life
- Solving problems involving remaining nuclei after a certain time

Sample Problem:

If a sample contains 10 grams of a radioactive isotope with a half-life of 5 hours, how much remains after 15 hours?

Solution Outline:

- Calculate the number of half-lives passed: $(15, \text{hours} / 5, \text{hours} = 3)$
- Remaining fraction: $((1/2)^3 = 1/8)$
- Remaining amount: $(10, \text{grams} \times 1/8 = 1.25, \text{grams})$

Kaplan solutions emphasize understanding these steps, ensuring students can approach similar problems with confidence.

Nuclear Reactions: Fission and Fusion

Nuclear reactions are central to energy production and fundamental nuclear physics principles.

- Find the average mass defect per fission event.
- Use $E=mc^2$ to find total energy.

Kaplan solutions guide students through these calculations, emphasizing understanding the physical principles behind each step.

Mass-Energy Equivalence and Nuclear Stability

Albert Einstein's famous equation, $E=mc^2$, underpins nuclear physics by linking mass and energy.

Mass Defect and Binding Energy

- The mass defect is the difference between the mass of a nucleus and the sum of its constituent nucleons.
- Binding energy is the energy required to break a nucleus into free nucleons.
- The greater the binding energy per nucleon, the more stable the nucleus.

Understanding Nuclear Stability

- Nuclei with high binding energy per nucleon (like Iron-56) are most stable.
- Light nuclei tend to fuse, releasing energy (fusion).
- Heavy nuclei tend to fission, releasing energy (fission).

Kaplan Solutions Methodology

- Calculating mass defect from atomic mass data.
- Deriving binding energy using $(E_b = \Delta m c^2)$.
- Comparing binding energies across different nuclei to assess stability.

Sample Problem:

Determine the binding energy per nucleon for an isotope with a mass defect of 0.1 u and 56 nucleons.

Solution:

- Convert mass defect to energy: $(E_b = 0.1 \text{ u} \times 931.5 \text{ MeV/u} = 93.15 \text{ MeV})$
- Divide by number of nucleons: $(93.15 \text{ MeV} / 56 \approx 1.66 \text{ MeV})$

Kaplan solutions stress the importance of understanding these relationships for predicting nuclear stability and reaction energetics.
